DAEMON THREAD IN JAVA

[o]

Daemon thread in java is a service provider thread that provides services to the user thread.

[o]

setDaemon (Boolean)

[o]

public Boolean isDaemon ().

[o]

Garbage collector is best example of Daemon thread.

[o]

Define :

Daemon Thread in Java is a low-priority thread that performs background operations such as garbage collection, finalizer, Action listeners, Signal dispatches etc.

[·] Example   File : My Thread. java

```java
public class TestDaemon1 extends Thread
{
    public void run ()
    {
        if (Thread. current Thread(). is Daemon ()
        {
            // Checking for a daemon thread
            System. out. println (" Deamon Works");
        }
        else
        {
            System. out. println (" user Thread Works");
        }
    }

    public static void main (String args [])
    {
        TestDaemon1 t1 = new TestDaemon1();
        // Thread Created.
        TestDaemon1 t2 = new TestDaemon1();

        t1. setDaemon (true);
                                // now t1 is daemon

        t1. start ();
        t2. start ();
    }
}
```

Output :   Daemon Works
            User Thread Works.
